AB - In exhaust gas purifying appts. where first converter in which first catalyst is contained and second converter in which second catalyst is contained are connected by pipes to internal combustion engine in this order, first catalyst consists of substrate, catalyst support layer of perovskite complex oxide RBO_3 or $R1-xAxBO_3$ and catalyst metals contg. at least Rh which is supported on catalyst support layer. In the formulae, R = element of Gp. IIa, IIb or (IIIa, B = element (other than R) of Gp. Ia, Ib, IIa, IIb, IIIa, IIIb, IVa, IVb, Va, Vb, VIa, or VIIa, A = element (other than R and B) of Gp. Ia, Ib, IIa, IIb, IIIb, IVa, IVb, Va, VIa or VIIa.

Preferred materials; as substrate is used cordierite, mullite, alpha-alumina, magnesia or spinel etc. Perovskite complex oxides are $RCeO_3$, $RZrO_3$, $RMoO_3$ (R=Ba or Ca) $CeAlO_3$, $LaAlO_3$, $LaFeO_3$ and $LaVO_3$, etc. Second catalyst consists of substrate, catalyst support layer of activated alumina and catalyst metals. First converter is placed near exhaust manifold of engine or motorcar and second converter is placed on underside of motorcar.

- ADVANTAGE :

As perovskite complex oxide and Rh do not form solid soln. at high temp., deterioration of catalytic properties and decline of durability by heat do not occur when high temp. exhaust gas is introduced in first catalyst.
